

The first nethome Fibre Spot in Switzerland

The housing estate Leuenfeld in Oensingen (SO) is to be completed by 2013, comprising 540 households, a swimming pool, a day nursery and a get-together area. The building owner and client Schmid Immobilien AG commissioned Network 41 to equip the estate in preparation for future communication solutions including telephone, internet and TV/radio.

In order to appeal to owners, tenants and service providers alike, Network 41 joined forces with Swisscom and the Oensingen TV association to install the first nethome Fibre Spot in Switzerland. This telecommunications infrastructure ensured cost optimisation as projected by Schmid Immobilien AG as well as providing a wider range of services. Each residential unit was fitted with four fibre optic cables in star formation, two of which are currently in use.

The central utility room allows other providers to be fed into the nethome Fibre Spot at any time. The set-up also ensures individual use by residents of TV, internet and telephone services.

In addition to planning the nethome Fibre Spot, Network 41 also carried out the electrical engineering work and project planning for the utility room. Network 41 conducted negotiations with the service providers and was responsible for advising owners on an individual basis, in particular regarding the options and system components for building automation. This pioneer project demonstrates Network 41's status as a leading specialist in the field of network planning in Switzerland.
