

Installation of test facility at new site in Fribourg

Network 41 relocates Ericsson test lab for fixed-line technologies

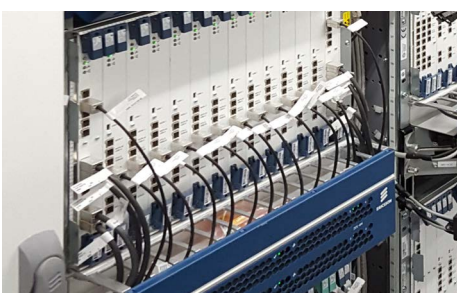

Ericsson is a system and equipment supplier and operates test laboratories for Swisscom which are used to simulate and test network environments for fixed-line technologies. The results are used to implement functioning applications in the live network. Network 41 was contracted to dismantle the Bern test laboratory, split it and reassemble it at different sites.

Ericsson moved into a new building in Bern in which there was insufficient space for an in-house test lab. For this reason, part of the equipment was to be integrated in an existing Swisscom lab in Ittigen while the rest was to be reassembled in Fribourg.

In addition to taking care of the dismantling work, disposal of equipment no longer required, transport preparation including load securing and transportation itself, Network 41 was also contracted by Ericsson to reassemble the test labs and put them into operation or integrate them in the existing laboratory.

«Some of the equipment was very heavy and bulky, so we even had to take down walls and rebuild them again in order to be able to get the units into the rooms and install them. Our telematics specialists also had the opportunity to install new systems that we are not familiar with – two challenges we handled very well thanks to the excellent support provided by Ericsson,» says Network 41 subproject manager Lukas Sennhauser.

Network 41 is a trusted professional when it comes to dismantling and reassembling your equipment!
