

More than 40 new cash machines throughout Switzerland

A Swiss bank is not just replacing outdated cash machines but – based on promising user figures – is also installing 40 new ones. Network 41 has been commissioned by Diebold to prepare the infrastructure for installation of the cash machines and will also be putting them into operation. The work takes just two days to complete at each bank site.

The desired location of the cash machine is specified directly inside the bank branch. Based on this positioning, Network 41 establishes the wiring and connections for the power, network and alarm systems and ensures that the installation work is coordinated and professionally carried out throughout Switzerland. Network 41 then puts the cash machines into operation and provides training for bank staff. All technicians involved have to meet the bank's rigorous security requirements.

«When it comes to installing the new cash machines, it's particularly important for us to coordinate the work closely with all those involved. Within a period of just two days, all the work has to be completed, bank staff trained and the cash machines ready for use by customers. It's quite a challenge but one we're very pleased to take on» says Abazi Driton, Network 41 project coordinator.

Coordination and planning – a key Network 41 tool
